

FORTH ON YOUR LGP-30?

More Likely Than You Think.

The **LGP-30**, by the **Librascope** company, is a powerful machine designed to be compact and power efficient. Smaller than a desk and able to run off a standard 120 volt wall outlet, this computer can comfortably operate without air conditioning, greatly reducing operational costs and overhead!

Containing state of the art electronics from 1956, using only **113 vacuum tubes** and a rugged **magnetic memory drum**, you can be sure to experience decades of reliable and high performance computing for a fraction of the price. Weighing less than a concert grand piano, this is even the perfect household computer.

That's why **KH-Labs** is proud to introduce you to our newest portable operating environment: **kopForth**. Built from the ground up, **kopForth** is designed to be a fast, efficient, and modular systems programming language with an emphasis on portability, hackability, and even a degree of standards compliance. Now available as **kopForth, LGP-30 Edition**, this

operating environment is the perfect choice for your **LGP-30**.

No longer will you need to use those outdated ALGOL or ACT-III languages, **kopForth** is here to bring you a modern programming experience. Making use of only three quarters of the available system memory for its operating system and extensive subroutine library, the user is left with **almost 1 kiloword** of remaining memory for writing general purpose algorithms without having to worry about the peculiarities of the **LGP-30's** instruction set.
